CUPIENNIUS REMEDIUS NEW SPECIES (ARANEAE, CTENIDAE), AND A KEY FOR THE GENUS

Friedrich G. Barth¹ and Detlev Cordes: Biozentrum, Institut für Zoologie, Universität Wien, Althanstr. 14, A-1090 Wien, Austria

ABSTRACT. A new representative of the neotropical genus *Cupiennius* Simon 1891 (Araneae, Ctenidae) was found in the highlands of central Guatemala. *Cupiennius remedius* new species is the ninth species established for the genus. Like all other species of *Cupiennius*, *C. remedius* is a hunting spider living in close association with monocotyledonous plants where it hides in a retreat during the day and is active at night. *C. remedius* is of medium size (carapace length *ca.* 8 mm) compared to the other species of the genus and is the only *Cupiennius* species known to live sympatrically with *C. salei*. Live animals show a spotted coloration pattern unusual for the genus. The distinctive features of the male bulbi and female epigyna are described and an example is given of the species-specific courtship vibrations. In addition, we provide a revised key for the genus *Cupiennius*.

RESUMEN. Hemos encontrado un nuevo representante del género neotropical Cupiennius Simon 1891 (Araneae, Ctenidae) en las regiónes montañosas del centro de Guatemala. Cupiennius remedius nueva especie es la novena especie establecida para el género. Como todas las otras especies de Cupiennius, C. remedius es una araña cazadora que vive en estrecha asociación con plantas monocotiledóneas, en las que se oculta durante el día en un refugio y es activa durante la noche. En comparación con las otras especies del género, C. remedius es de tamaño intermedio (alrededor de 8 mm de longitud del caparazón) y es la única especie de Cupiennius que se sabe que vive en simpatría con C. salei. Los animales vivos presentan un patrón de coloración manchado que no es habitual en el género. Describimos las características distintivas de los bulbos de los machos y de los epiginos de las hembras e incluimos un ejemplo de las vibraciones de cortejo específicas de la especie. Además, incluimos una clave revisada del género Cupiennius.

When we first revised the genus *Cupiennius* Simon 1891 (Lachmuth et al. 1984) the genus contained 21 nominal species. Seven species from Central America (including northern Columbia, Cuba, Haiti, and Jamaica) were recognized by the structure of their genital organs. Six of the seven species (the exception being *C. granadensis* (Keyserling 1877)) have been bred successfully in the laboratory.

Among the species excluded from the genus in our previous revision was *C. celerrimus* Simon 1891. The main reason for the exclusion was the lack of a holotype, the locality in Brazil which appeared unlikely for the genus, and the fact that *C. celerrimus* had not been found since 1891. However, Brescovit & von Eickstedt (1995) recently redescribed *C. celerrimus* from Brazil; and we have therefore included it in our revised key as the ninth species of the genus *Cupiennius*.

¹To whom correspondence should be addressed.

A particular incentive for the clarification of the taxonomy of *Cupiennius* is the importance of some of its representatives in studies in sensory and behavioral physiology (Barth 1985, 1993; Barth et al. 1993a,b, 1995; Humphrey et al. 1993; Lachmuth et al. 1984; Land & Barth 1992; Strausfeld & Barth 1993). An extensive study of problems in reproductive isolation of the species (Barth 1993) also prompted a PCR-analysis of DNA-sequences which provided evidence for the polyphyly of the family Ctenidae to which the genus *Cupiennius* is assigned (Huber et al. 1993).

Cupiennius remedius new species was found in 1992 while searching for C. salei (Keyserling 1877) in the highlands of central Guatemala at the Finca Remedios (Fig. 1). C. remedius is the only species of the genus known to live sympatrically with C. salei. The present study describes the new species and in addition provides a revised key for the genus. The key also considers some new aspects

which have emerged from many years of research in the field and in the laboratory as well as from breeding most of the species.

Cupiennius remedius new species Figs. 1-5, 13

Types.—Male holotype, two male and four female paratypes were collected at the Finca Remedios on 12 February 1992 (F.G. Barth, R. Felber). One of the spiders was collected as a juvenile and developed into an adult male in the laboratory. The holotype and one female paratype are in the arachnological collection of the Senckenberg Museum, Frankfurt am Main, Germany. The other paratypes

remain in the collection of the Zoology Department of the University of Vienna, Austria.

Etymology.—The name of the new species refers to the type locality, i.e., Finca Remedios.

Diagnosis.—Morphologically, C. remedius forms a group together with C. foliatus F.P.-Cambridge 1901 and C. panamensis Lachmuth et al. 1984, of which it is the largest (Fig. 2). The spotted appearance of its habitus is unique among all known species of Cupiennius (Fig. 3). In addition, male C. remedius differ from male C. foliatus by the terminal apophysis of their bulbs which is not elevated at the embolic base (stipes-embolus) as it is in C. foliatus (Figs. 30, 31). Regarding the females, a prominent difference between C. remedius and C. foliatus is the shape of the lateral plates of the epigynum at their anterior end (Fig. 14a). Apart from the spotted habitus, the lateral plates of the epigynum also distinguish C. remedius from C. panamensis. In C. remedius, the lateral plates are not continuous with the median septum (Fig. 14a). Whereas the vulvae are strikingly similar in C. remedius and C. foliatus (Fig. 22), the shape of the seminal ducts leading to the seminal receptacles I clearly differs between C. remedius and C. panamensis (Figs. 21, 22). The strong twisting of the seminal ducts of the first receptacles in C. remedius and C. foliatus is very conspicuous but typical of C. salei as well (see Figs. 15, 22).

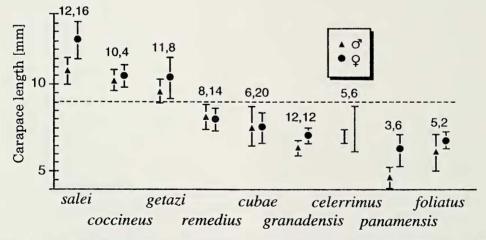

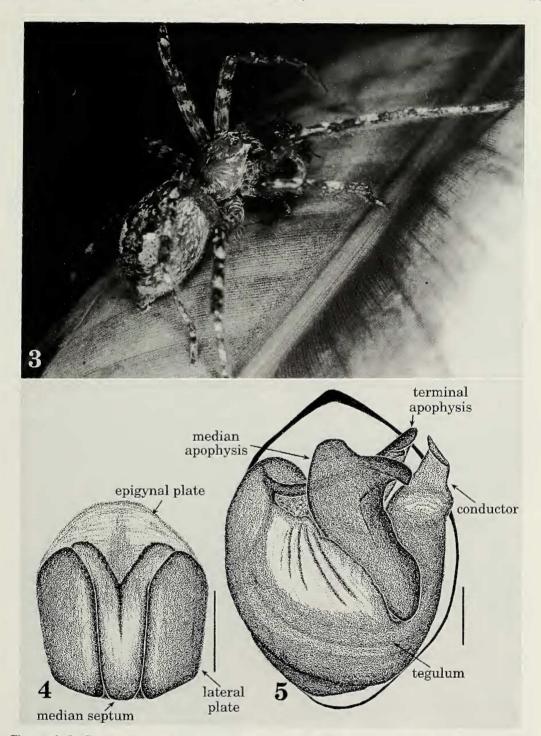

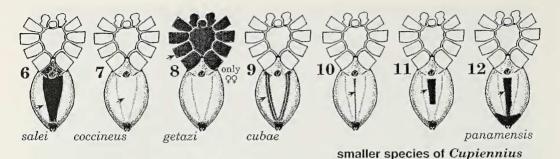

Figure 2.—Size distribution of the nine known species of *Cupiennius*, indicated by the carapace lengths of male and female representatives. Number of individuals measured is given above the symbols. Bars represent standard deviation of the mean; for n < 7 the bars instead represent the range of values. For *C. celerrimus* the range of values given is taken from Brescovit & Eickstedt 1995.

Figures 3-5.-Cupiennius remedius new species. 3, Adult female, feeding on a fly; 4, Epigynum of female paratype, ventral view; 5, Bulb and terminal parts of embolus of male holotype, ventral view. Scale = 0.5 mm.

Figures 6–12.—Schematized view of the ventral body of different species of *Cupiennius* to show diversity of ornamental patterns (see arrows). 6, *C. salei*; 7, *C. coccineus*; 8, *C. getazi*; 9, *C. cubae*. 10–12. Smaller *Cupiennius* species, range of pattern variability (12, *C. panamensis*).

Description.—Males: Prosoma 7-9 mm long ($\bar{x} = 8.2$ mm, Fig. 2), medium brown with a patchy pattern dorsally (Fig. 3). Opisthosoma dorsally medium brown with light brown markings along the cardiac mark; ventrally light with a slight brown indication of a narrow median stripe or with a distinct dark and narrow median stripe (Figs. 10, 11), variable. Legs light brown without ring-shaped patterns; femur clearly lighter than the other leg segments; tarsus, metatarsus, and tibia covered by conspicuous long thin hairs ventrally and laterally. Pedipalps medium brown with a short tibial apophysis typical of the genus. Bulb (Fig. 5) with its prominent median apophysis slightly curved with a round ter-

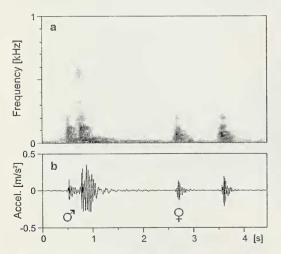

Figure 13.—Sonagram and oscillogram of representative substrate borne male courtship vibration and female vibratory response of *Cupiennius remedius* new species. Signals were recorded on a bromeliad using an accelerometer.

minal and a large shovel-like lateral process; conductor largely flat and tip bent towards tegular apophysis; terminal elements (Fig. 30): embolic apophysis distinctly curved, terminal apophysis leaf-like and covering the embolic opening.

Females: Prosoma 7.4–9.3 mm long ($\bar{x} =$ 7.9 mm, Fig. 2), medium brown with a light brown, patchy pattern dorsally (Fig. 3). Opisthosoma dorsally medium brown with light brown markings along the cardiac mark; ventral side light with a dark narrow median stripe (Figs. 10, 11). Legs medium to light brown with distinct annular patterns (Fig. 3). Epigynum (Fig. 4) with narrow median septum slightly narrowing distally and dividing into two parts proximally (bordering the lateral plates), its Y-shape similar to that of C. foliatus; lateral plates elevating towards median septum and connecting to the border of the epigynal plate anterio-laterally; vulva with more or less ball-shaped first receptacles and seminal ducts strongly winding dorsally and proximally (Fig. 22).

Courtship behavior.—Cupiennius remedius is the seventh among all known species of the genus (together with C. salei, C. getazi Simon 1891, C. coccineus F.P.-Cambridge 1901, C. cubae Strand 1910, and C. foliatus) which has been shown to be a biospecies. We have bred C. remedius in Vienna and also observed its courtship behavior. As known from extensive studies with other species of Cupiennius (Barth & Schmitt 1991; Barth 1993), the vibrations exchanged between male and female during courtship are important in the reproductive isolation of the species; and it is in particular the male courtship vibration which helps the female to

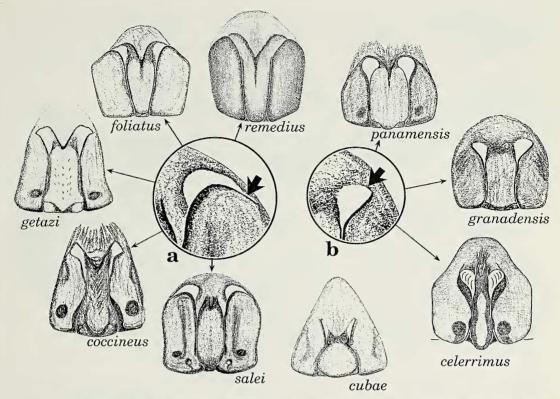

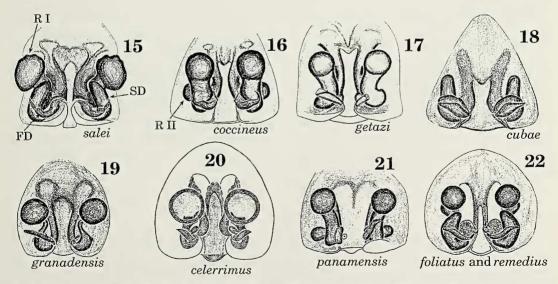

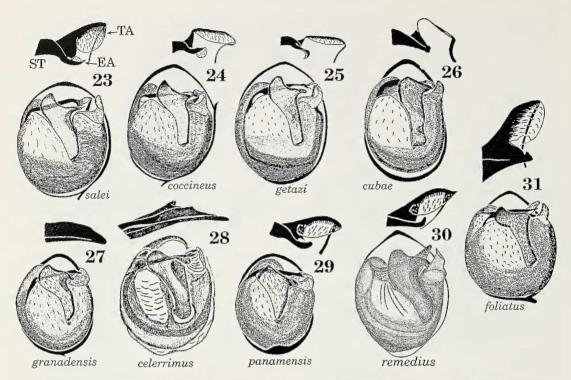

Figure 14.—Ventral view of epigyna of the females of all nine species of *Cupiennius*. Note two groups **a** and **b** which differ with regard to the way in which the lateral plates are connected to the epigynal plate anterio-laterally. See Fig. 3 for nomenclature of various parts. Modified and adapted from Lachmuth et al. 1984 and from Brescovit & von Eickstedt 1995 (*C. celerrimus*).

Figures 15–22.—Epigyna of the females of the nine *Cupiennius*-species. Seen in dorsal view (from inside) and showing the seminal receptacles I and II (RI, RII), the seminal duct (SD) and the fertilization duct (FD). Modified and adapted from Lachmuth et al. 1984 (Figs. 15–19, 21, 22) and Brescovit & von Eickstedt 1995 (Fig. 20).

Figures 23–31.—Bulbi genitales and terminal parts of the embolus of the males of all nine species of *Cupiennius*. For the terminology of the various parts see Fig. 3; TA = terminal apophysis, SE = stipes embolus, EA = embolic apophysis. Modified and adapted from Lachmuth et al. 1984 (Figs. 23–27, 29, 31) and from Brescovit & von Eickstedt 1995 (Fig. 28).

recognize its conspecific partner. In *C. remedius* the male vibration results from up and down movements of the opisthosoma (without touching the substrate; Dierkes & Barth 1995) and does not come in series of syllables as in *C. coccineus, C. getazi,* and *C. salei* (Barth 1993). Instead it is a single syllable resulting from a short bang of the pedipalps onto the dwelling plant followed by just one or two cycles of the opisthosomal movement (Fig. 13). The main frequency components are around 30 Hz in case of both the male vibration and the female response.

Distribution.—Until now, C. remedius was

known only from the type locality. The Finca Remedios is located in the Departamento Alta Verapaz near Coban at an altitude of about 700 m (Fig. 1) and with the climate typical of the "tierra templada" (Barth & Seyfarth 1979; Barth et al. 1988). All animals were collected at the edge of a banana plantation 4 km east of the finca house and close to a small brook and an unpaved road. The spiders all sat behind the trough-shaped basal parts of banana leaf sheaths which are typical retreats of other species of *Cupiennius* as well (Barth et al. 1988).

KEY TO THE SPECIES

The following key includes the description of the coloration patterns, typical of living representatives of the species. In the larger species, this permits determination of the species even for subadult specimens. The coloration may be indistinct or even absent in preserved specimens. Then the shape of the epigynum, vulva and bulbal sclerites is of major importance. Especially the smaller species of *Cupiennius* have an indistinct or variable coloration pattern on their body and legs. Their determination is possible only by dissecting the vulva (females) or looking at small details of the male bulb. The key includes all important features of the genitalia already described in Lachmuth

et al. (1984). Besides including *C. remedius* and *C. celerrimus*, it extends the previously published key by considering body size and additional characters of the coloration pattern and of the genitalia. The definition of the colors used in the key is taken from a color table of color-pencils from Faber-Castell, Germany.

Adult Females:

	Adult Females.
1.	Large spider (carapace length > 9 mm) (Fig. 2); legs and/or body with conspicuous markings
	or color pattern
	Medium sized spider (carapace length < 9 mm) (Fig. 2); legs and/or body uniformly brown or with comparatively indistinct or variable markings
2(1)	Legs brown with conspicuous dark markings
2.(1)	Femora I–IV bright carmine-red ventrally; prosoma and opisthosoma medium to dark brown
	dorsally with a darker median band; ventral opisthosoma without any dark markings (Fig. 7);
	epigynum with narrow median septum, widening distally; distal part of septum with strongly
	sclerotized hook (Fig. 14a)
3.(2)	Femora I-IV with distinct black annular patterns; prosoma dorsolaterally with light grayish-
	brown pattern contrasting the darker median band; coxae densely covered with terra cotta red
	hairs ventrally; ventral opisthosoma always with broad black median stripe (Fig. 6); in some specimens pairs of yellowish to whitish spots disto-laterally on both sides of the cardiac mark;
	epigynum with narrow median septum of uniform width (Fig. 14a); body length up to 45 mm
	(largest species, Fig. 2)
	Femora I-IV on the ventral side with many small black spots; either sternum or sternum and
	coxae (variable) dark brown to black (Fig. 8); dorsally, body coloration distinct and species-
	specific: median dark band on prosoma, colored areas laterally on the body; dark cardiac mark
	(opisthosoma); dark inverse V-shaped stripes, distal to cardiac mark; ventral opisthosoma light
	brown (populations from Barro Colorado Islands and from Panama were observed to have only a dark median ventral opisthosomal band, and no speckled femora). A grayish morph and an
	orange morph exist. Epigynum with broad median septum of roughly uniform width, but wid-
	ening distally (Fig. 14a); distal part of septum with sclerotized nose-like processgetazi
4.(1)	Epigynal plate oval or trapezoid
	Epigynal plate distinctly triangular (Fig. 14b); median septum of epigynum strongly widened
	distally forming a sphere; seminal receptacle I cone-like; body color in general uniformly gray-
	ish to brownish, ventral opisthosoma with outlines of a dark median band, consisting of a series of short dark reddish hairs (Fig. 9)
5.(4)	Lateral plate of epigynum directly connected to the median septum forming a loop (Fig. 14b)
- (.)	6
	Lateral plate of epigynum not directly connected to the median septum and extending to the
	anterior-lateral border of the epigynal plate (Fig. 14a)
6.(5)	Epigynum with narrow median septum, seminal receptacles I with seminal ducts of different
	shapes: S-shaped, twisted, winding or rolled
	ceptacles I ball-shaped with seminal ducts sturdy and slightly curved laterally (Fig. 21); pro-
	soma light brown; opisthosoma darker brown, with narrow dark-shaded median band ventrally
	(Fig. 11); smallest species (Fig. 2) panamensis
7.(6)	Median septum with parallel borders, distally ending broad, and with a small hook (Fig. 14b);
	vulva: seminal receptacles I with distinctly S-shaped seminal ducts (Fig. 19) granadensis
	Median septum long, narrow and slightly widening distally (Fig. 14b); vulva: seminal receptacles large and ball-shaped, seminal ducts rolled dorso-ventrally (Fig. 20); body orange
	to brown with darker brown median band, legs I–IV yellow ventrally on coxae and femora
	celerrimus
8.(5)	Lateral plates of epigynum ending rounded before connecting to the epigynal plate (Fig. 14a),
	median septum of epigynum narrow and continuously narrowing distally (Fig. 14a); vulva with
	ball-shaped seminal receptacles, seminal ducts strongly winding (Fig. 22); medium large spider
	(carapace length 7-8 mm); annular patterns on femora, and body remarkably spotted (Fig. 3); tarsi of legs I-IV with long dark hairs both dorsally and ventrally remedius new species
	Lateral plates of epigynum ending as indicated in Fig. 14a before connecting to the anterior-
	lateral end of the epigynal plate, median septum of epigynum as in Fig. 14a; seminal receptacles
	I ball-shaped, seminal ducts as in Fig. 22; spider smaller (carapace length up to 7 mm); body

Adult Males:

	Adult Males:
1.	Large spider (carapace length > 9 mm) (Fig. 2). Legs with conspicuous markings (except one case, see 2.); body light gray, light brown to medium brown or bright orange dorsally; ventral opisthosoma with or without broad dark median stripe
2.(1)	Legs and/or body with conspicuous markings
3.(2)	curved and twisted (Fig. 24)
	2)
	able); conspicuous species-specific body coloration: a dark median band dorsally on prosoma and opisthosoma bordered by light areas laterally; dark cardiac mark dorsally on opisthosoma, and dark inverse V-shaped stripes posterior to it; two morphs with either grayish or orange
	basic coloration. Bulb with terminal apophysis bent downwards, embolic apophysis strongly curved and twisted (Fig. 25)
4.(1)	Opisthosoma with narrow dark median stripe ventrally (Figs. 10–12) or without ventral markings
5.(4)	26) with median apophysis comparatively straight and notched in the proximal third of its length, distal process and lateral shovel-like process very small, terminal apophysis strongly domed and extending over the short embolic apophysis. Body grayish or brownishcubae Bulb with embolic base (stipes-embolus) massive (Figs. 27, 28), terminal and embolic apophysis
	not distinct
6.(5)	21)
	Embolic base (stipes-embolus) strongly folded forming two furrows (Fig. 28); embolic tip appears severed with a pair of short processes; body and legs orange with a brown median band on pro- and opisthosoma; ventral surface of coxae and femora yellow celerrimus
7.(5)	Terminal apophysis levels with the embolic base (stipes-embolus) (Figs. 29, 30)
8.(6)	the cardiac mark
	terior part of the opisthosoma (Fig.12)

ACKNOWLEDGMENTS

We are very grateful to the Schleehauf family, owner of Finca Remedios, for their generous hospitality and kind assistance in Guatemala. The field work (F.G. Barth, R. Felber) in Guatemala in 1992 was made possible by financial support from the Austrian Science Foundation (FWF, P 7896B to F.G.B.). We thank Carmen Fernandez-Montraveta for translation of the abstract into Spanish. We also thank A. Brescovit and V. von Eickstedt for providing the original drawings of the genitalia of *C. celerrimus* and much appreciate the comment of a reviewer who pointed out to us the reference where these figures first appeared.
